

## Wireless Tools

## UNWIRED

www.sxc.hu

Sunshine, pool, laptop, an open WLAN, and Wireless Tools were all it took for Heike to submit the latest issue of "Command Line" from Crete.

BY HEIKE JURZIK

**W**ireless Tools [1] is a collection of command-line programs that not only serve up information on WLANs but also help you configure wireless connections.

## The Tools

The tool set includes the following:

- *iwconfig* – Displays information about and configures WLAN interfaces
- *iwlist* – Displays information on your options and WLANs in the vicinity
- *iwgetid* – Displays information on existing interfaces, just like *iwconfig*, but does not offer configuration options
- *iwpriv* – Sets up various driver-specific parameters
- *iwspy* – Collects information on other WLAN clients
- *iwevent* – Monitors WLAN interfaces

## The Suite

Likely, you will find this collection of programs in your distribution's repository in the wireless-tools package; com-

puters with a WLAN interface will typically have the package pre-installed.

With some distributions, the Wireless Tools suite additionally includes the *ifrename* program. Debian users can install the tool from a package of the same name. To use the pre-installed programs,

you must install and load the drivers for your WLAN card.

## iwconfig

*iwconfig* works like *ifconfig*: Called without any additional parameters, it will give you a whole bunch of information about your network interfaces in a terminal window.

Figure 1 shows the output on a laptop, with *lo* as the loopback interface, *eth1* as a normal network card, and *eth0* as a WLAN interface.

A connection to a network called *cretablue* has been established; the WLAN card's name is *Broadcom 4318*. The access point for the *cretablue* network tells you its MAC address and that it is running in managed mode.

### Listing 1: dhclient

```
01 # dhclient eth0
02 ...
03 DHCPDISCOVER on eth0 to
   255.255.255.255 port 67
   interval 8
04 DHCPDISCOVER on eth0 to
   255.255.255.255 port 67
   interval 19
05 DHCPOFFER from 192.168.1.254
06 DHCPREQUEST on eth0 to
   255.255.255.255 port 67
07 DHCPACK from 192.168.1.254
08 bound to 192.168.1.72 --
   renewal in 38488 seconds.
```

## GLOSSARY

**ifconfig:** One of the most important network configuration tools. When called without any additional parameters, *ifconfig* will show you the currently configured network interfaces. Most distributions store the program in the */sbin* directory so that normal users will need to specify the full path, */sbin/ifconfig*. Administrators can use *ifconfig* to set up network cards in the shell.

```

huhn@samesame:~$ /sbin/iwconfig
lo        no wireless extensions.

eth1      no wireless extensions.

eth0      IEEE 802.11b/g  ESSID:"cretablue"  Nickname:"Broadcom 4318"
Mode:Managed  Frequency=2.437 GHz  Access Point: 00:40:05:52:24:F6
Bit Rate=11 Mb/s   Tx-Power=18 dBm
RTS thr:off   Fragment thr:off
Link Quality=100/100  Signal level=3/3  Noise level=184/100
Rx invalid mwid:0  Rx invalid crypt:28  Rx invalid frag:0
Tx excessive retries:0  Invalid misc:0  Missed beacon:0

sit0      no wireless extensions.

huhn@samesame:~$

```

Figure 1: If you need to query and change WLAN parameters, `iwconfig` can help.

If you prefer not to see the information for the other interfaces, pass the name of the interface you are interested in to `iwconfig`, for example:

```
/sbin/iwconfig eth0
```

The system administrator `root` can run the command without specifying the path because it resides in `/sbin`, which is in `root`'s path.

## Setting Up an Interface

Besides the network interface name, `iwconfig` supports other command-line

options, which follow the command shown previously. The following commands change an existing configuration and require root privileges. To associate with another network, you must specify the **ESSID**, which follows the `iwconfig` command and the interface name:

```
iwconfig eth0 essid "Beach Cafe"
```

If the network name includes blanks or special characters, you need to place it in double quotes. If the network uses a WEP key, you can use the `key` option to

specify it. To do so, either enter the key in hexadecimal notation or type `s:` followed by the WEP password:

```
iwconfig eth0 essid "Beach Cafe" \
key s:IceCreamRocks
```

If needed, you can also define the channel you are using (*channel 11*), specify the mode (e.g., *mode Managed* or *mode Ad-Hoc*, and so on), specify the nickname you will use on the network (e.g., *nick "External Cisco Card"*), and many other things. The man page for `iwconfig` has a full list. Don't forget to configure the IP address for your card. Most public networks will support automatic IP address assignments via DHCP; `root` can use the `dhclient` program for this. If needed, you can pass an interface name in to this tool (Listing 1).

## Tracker

`iwlist` is another handy tool; you can use the *scanning* option to look for available wireless networks (Listing 2).

If you are more interested in the frequencies and channels your WLAN card supports, type the *frequency* option. Other parameters include the supported bit rates (*iwlist bit rate*), encryption mechanisms (*iwlist encryption*), or the transmitter power (*iwlist power*).

`iwgetid` is a kind of lightweight `iwconfig`. By default, it gives you a single line that tells you which interface is associated with which (E)SSID:

```
# iwgetid
ath0      ESSID:"cretablue"
```

`iwgetid` is thus perfect for scripting.

Various options will tell the program to display other details. For example,

### Listing 2: iwlist Scanning Option

```

01 # iwlist scanning
02 eth0 Scan completed :
03     Cell 01 - Address: 00:14:6C:91:77:EC
04         ESSID:"Poolbar upstairs"
05         Protocol:IEEE 802.11bg
06         Mode:Master
07         Channel:6
08         Encryption key:off
09         Bit Rates:1 Mb/s; 2 Mb/s; 5.5 Mb/s; 9 Mb/s; 11 Mb/s
10             6 Mb/s; 12 Mb/s; 18 Mb/s; 24 Mb/s; 36 Mb/s
11             48 Mb/s; 54 Mb/s
12         Quality=100/100  Signal level=-217 dBm
13         Extra: Last beacon: 884ms ago
14     Cell 02 - Address: 02:20:A6:B7:04:41
15         ESSID:"STAR_BEACH"
16         Protocol:IEEE 802.11bg
17         Mode:Master
18         Channel:11
19         Encryption key:off
20         Bit Rates:1 Mb/s; 2 Mb/s; 5.5 Mb/s; 11 Mb/s; 22 Mb/s
21         Quality=100/100  Signal level=-145 dBm
22         Extra: Last beacon: 232ms ago

```

## GLOSSARY

**ESSID:** Extended Service Set Identifier. A unique identifier for an IEEE 802.11 wireless network with a maximum of 32 digits. The ESSID disambiguates multiple wireless networks at the same place.

## INFO

[1] Wireless Tools: [http://www.hpl.hp.com/personal/Jean\\_Tourrilhes/Linux/Tools.html](http://www.hpl.hp.com/personal/Jean_Tourrilhes/Linux/Tools.html)

**Listing 3: iwevent**

```

01 # iwevent
02 Waiting for Wireless Events from interfaces...
03 16:36:21.690798  ath0    Scan request completed
04 16:39:51.557551  ath0    Set ESSID:"STAR_BEACH"
05 16:40:01.063199  ath0    Set ESSID:"cretablue"
06 16:40:01.063238  ath0    New Access Point/Cell
    address:Not-Associated
07 16:40:01.456160  ath0    Scan request completed
08 16:40:01.839243  ath0    Scan request completed
09 16:40:02.184058  ath0    Scan request completed
10 16:40:02.184107  ath0    Custom driver event:
    associating failed because no suitable network
    was found
11 ...

```

--ap gives you the access point MAC address, --freq shows the frequency, --channel gives you the channel, and so on.

**Listening In**

*iwevent* gives you a kind of logfile for wireless events and monitors activity on the wireless network by default (see Listing 3).

To stop listening, press Ctrl + C. If you need information on other WLAN users in the same radio cell, you can use *iwspy*. To do so, first ping the IP addresses,

```

$ ping 192.168.1.100
PING 192.168.1.100
(192.168.1.10
0) 56(84) bytes of data.
64 bytes from
192.168.1.100: icmp
p_seq=1 ttl=64 time=6.23
ms
...

```

then pass in your own interface and the IP address of the remote computer:

```
iwspy ath0 192.168.1.100
```

*iwspy* then gives you details about the connection quality, signal strength, the MAC address of the other client, and so on (Listing 4).

**All Inclusive**

As you can see, you don't need a complicated GUI tool to set up your network configuration and send a document from Greece to the office back home – the Wireless Tools suite gives command-line fans everything they might need on vacation.

After finding the best network in the vicinity and establishing a connection, the programs even let you keep a close eye on your fellow vacationers. ■

**Listing 4: iwspy**

```

01 # iwspy ath0
02 ath0    Statistics collected:
03    00:C0:A8:D4:6F:EC : Quality:2  Signal level:0
    Noise level:3
04    Link/Cell/AP      : Quality=30/94  Signal
    level=-64 dBm  Noise level=-94 dBm
05    Typical/Reference : Quality:0  Signal level:0
    Noise level:0

```
